

Junior AI/ML Developer - WFH

Dear Candidate,

Thanks for your interest in our position **Junior AI/ML Developer**.

We are looking for an enthusiastic Junior AI/ML Developer to join our expanding technology team. This position is ideal for a recent graduate or junior developer with an interest in Python programming, API development, Artificial Intelligence (AI), Machine Learning (ML), predictive analytics, and building intelligent software solutions.

Project Overview

Initially, you will be working on MIRA – Medical Intelligence Robotic Automation, an innovative platform that combines Artificial Intelligence (AI), Machine Learning (ML), predictive analytics, Robotic Process Automation (RPA), and modern Python-based web technologies to optimise healthcare operations. MIRA is designed to automate key clinical and administrative workflows, generate intelligent insights from healthcare data, and improve operational efficiency through smart automation and AI-powered solutions.

In this role, you will contribute to the development of Python-based applications, integration of AI-powered modules, support for predictive analytics systems, and software development projects focused on predictive analysis, automation, and intelligent decision-making within the healthcare industry.

You will also gain exposure to modern healthcare AI ecosystems, including cloud-based AI services, predictive analytics platforms, and custom healthcare intelligence solutions.

Key Responsibilities:

- Develop and maintain Python applications and modern backend frameworks integrated with AI/ML solutions
- Assist with integration of AI/ML modules into healthcare software platforms
- Support predictive analytics and intelligent data processing solutions
- Contribute to AI-driven automation projects and workflow optimisation initiatives
- Work with healthcare-related datasets to generate insights and improve system efficiency
- Collaborate with senior developers, analysts, and project teams on software solutions
- Stay updated with emerging technologies in AI, machine learning, healthcare systems, and automation tools

Mandatory Requirements:

- Graduate or above (current students are NOT eligible)
- Knowledge or experience in Python programming
- Understanding of REST APIs and backend development concepts
- Knowledge of AI/ML fundamentals and predictive analytics concept
- Strong attention to detail and accuracy.
- Work 8 hours per day (Work From Home), Monday to Saturday, starting from 6:00 AM
- Own laptop or PC with a high-speed internet connection
- Strong communication skills (both written and verbal)
- Able to Join within 2 weeks
- Able to Work independently with minimal supervision
- Experience in Microsoft Word, Excel, and PowerPoint
- Must be a team player, professional, and a self-learner

Please continue below only if you meet all mandatory requirements.

Junior AI/ML Developer - WFH

Due to the high volume of applications, we receive for this role, we want to ensure that every shortlisted candidate has a fair and equal opportunity to demonstrate their technical abilities — rather than being assessed solely based on a CV.

As part of our evaluation process, shortlisted candidates are required to complete two technical assessments before progressing to the interview stage. Task 1 focuses on assessing your AI/ML knowledge, problem-solving approach, coding standards, and ability to develop a practical real-world solution.

Task 1: Evaluation of AI/ML Skills

Scenario: Health Prediction Application using patient blood test results and an external AI/ML Health API.

Description: Create a basic health prediction application using Python as the backend and any frontend technology of your choice, including HTML/CSS, Bootstrap, React.js, Vue.js, Tkinter, PyQt, Streamlit, Dash, or any other suitable framework/library. The solution may be developed as a web application, desktop application, or mobile application, depending on your preferred technical stack.

The application should collect and manage the following information for each contact:

- Full Name
- Date of Birth
- Email Address
- Glucose
- Haemoglobin
- Cholesterol
- Remarks(Generated from AI)

Requirements:

1. **CRUD Operations:** The application must allow users to Create, Read, Update, and Delete the records.
2. **User Interface:** Design a simple, clean, and user-friendly interface that allows easy navigation and efficient data management..
3. **Data Validation:** Implement basic input validation to ensure data is entered in the correct format (e.g., valid email address format, date of birth cannot be a future date, and blood test values must be numeric).
4. **Persistent Storage:** Use a database or any persistent storage mechanism to store the patient records.
5. **AI/ML API Integration:** Once valid patient data is entered, the application should:
 - Call any external AI/ML or Health-related API
 - Predict a possible health condition or disease risk
 - Display the prediction result in the “Remarks” field/column

Applicants may use any suitable public API, Health API, AI service, ML service or custom ML model for the prediction process.

Please upload your source code to GitHub. Before uploading Remove all passwords, API keys and any sensitive configuration values

We will assess:

- Your overall problem-solving approach
- Code quality and structure
- API integration capability
- Frontend and backend implementation
- GitHub project organization
- Clarity, maintainability, and logic of the code

Once you completed the task, please send us the following:

- Github repository link
- Demo Video - using any free screen recording tool (such as OBS Studio or Zoom), record a walkthrough of your application demonstrating its CRUD functionality. In the video, also explain why you chose this technology stack and discuss any challenges you encountered during development.

Please email all the above to jobs@gokulinfocare.com

If the attachment is too large for email, please upload it to Google Drive and send us the access link. Ensure the link is set to allow access to everyone and double-check that it's accessible before sharing it with us.

We follow a **first-come, first-served** process — the earliest and best-quality submissions will move to the next stage.

Submissions containing fully AI-generated implementations or content without clear understanding of the solution may be disqualified during the evaluation process.
